AEZAZ

Data Analyst

Ahmedabad, India | 9726267338 | tunvaraezazkhan@gmail.com | GitHub

ABOUT ME

I enjoy taking a question I'm curious about and seeing what the data says. Most of these projects started from something I came across and thought, "I wonder if I can actually test that?" I use SQL, Python, Excel and Power BI to turn those questions into small experiments — usually involving things I already find interesting.

PROJECTS & DATA EXPERIMENTS

Where Did All the Inventory Money Go? | *SQL • Python • Excel • Power BI*

- Explored how demand, stock levels, lead times, suppliers and purchasing frequency can leave too much money tied up in inventory.
- Flagged products with high inventory value but low demand and compared overstocking with stockout patterns.
- Built supplier comparisons using cost, delivery reliability, lead-time variation and defects.
- Tested "what-if" scenarios to see how reducing inventory could affect service levels.

F1 Strategy Analyst — Because Pit Stops Are Data Problems | *Python • Pandas • SQL • Data Visualization*

- Used race and lap data to explore tyre strategy, pit-stop timing, safety cars and track position.
- Compared stint lengths and tyre degradation to see when an early stop, late stop, undercut or overcut makes sense.
- Built strategy comparisons around one question: given the information available, when would I have pitted?
- Created visual race timelines to make strategy decisions and trade-offs easier to understand.

Football Transfer Detective — Finding the Undervalued Player | *Python • SQL • Statistics • Visualization*

- Compared player performance with transfer fees to explore whether the market always prices on-pitch contribution fairly.
- Built position-aware comparisons using age, minutes, goals, assists, chance creation, defensive actions and progression.
- Created an "undervaluation score" to surface players whose numbers looked better than their price suggested.
- Checked whether apparent bargains were actually driven by small samples, weaker leagues or unusually strong seasons.

SKILLS

SQL • Python • Pandas • NumPy • Excel • Power BI • Data Cleaning • EDA • Statistics • Data Visualization • Dashboard Design

EDUCATION

BSC IT Software Development — Department Of Animation | 2025

EXPERIENCE

No formal work experience yet. Currently building practical experience through independent data projects and experiments.

Built out of curiosity. Open to interesting problems.
